

PayFlow GST - Product Requirements Document (PRD)

Version: 1.0 MVP

Technology Stack: React (Frontend), Node.js/Express (Backend), PostgreSQL (Database)

1. Executive Summary

PayFlow GST is a SaaS platform for Indian micro and small businesses that helps users create GST-compliant invoices, track receivables, manage collections, and improve cash flow through automated reminders and reporting.

2. Problem Statement

Small businesses often manage invoices through Excel, notebooks, or disconnected tools. Outstanding payments are difficult to track, collections are manual, and GST reporting is time-consuming.

3. Target Market

Hardware dealers, electrical wholesalers, steel suppliers, distributors, traders, and service businesses with 1–20 employees and annual turnover between ₹10 lakh and ₹10 crore.

4. Product Goals

- Create invoices in under 60 seconds
- Improve collection efficiency
- Provide visibility into receivables
- Simplify GST reporting

5. Non-Goals

- Inventory management
- Payroll
- Multi-warehouse management
- Full accounting replacement

6. User Personas

Rajesh, owner of an electrical supply business, needs simple billing, visibility into outstanding payments, and easier GST reporting.

7. Functional Requirements

A. Authentication & Authorization

- Register
- Login
- Password reset
- Role-based access

B. Business Profile

- GSTIN
- Address
- Logo
- Contact details

C. Customer Management

- Create, edit, search customers
- View customer outstanding balance

D. Invoice Management

- GST calculations
- Invoice numbering
- PDF generation
- Invoice status tracking

E. Payments

- Full and partial payments
- Payment methods
- Payment history

F. Collections

- Aging buckets
- Overdue tracking
- Reminder scheduling

G. Reports

- Sales reports
- GST summary
- Outstanding reports
- Excel/PDF export

8. Dashboard Requirements

Revenue, outstanding amount, overdue invoices, recent activity, top debtors, and collection performance.

9. User Flows

User Registration → Business Setup → Customer Creation → Invoice Creation → Invoice Delivery → Payment Recording → Reporting.

10. Non-Functional Requirements

Performance:

- Page load < 2 seconds
- API response < 500ms

Security:

- JWT authentication
- Password hashing (bcrypt)
- HTTPS
- Audit logs

Scalability:

- Multi-tenant architecture
- Horizontal API scaling

11. Database Design Overview

Tables:

- users
- businesses
- customers
- invoices
- invoice_items
- payments
- reminders
- reports

Relationships:

Business → Customers

Customer → Invoices

Invoice → Payments

12. API Overview

POST /auth/register

POST /auth/login

GET /customers

POST /customers

GET /invoices
POST /invoices
POST /payments
GET /reports

13. Frontend Architecture (React)

React
React Router
TanStack Query
Axios
Material UI or Shadcn UI
Formik + Yup

Pages:
- Login
- Dashboard
- Customers
- Invoices
- Payments
- Reports
- Settings

14. Backend Architecture (Node.js)

Node.js
Express.js
PostgreSQL
Prisma ORM

Layers:
Routes
Controllers
Services
Repositories
Database

15. MVP Milestones

Phase 1: Authentication
Phase 2: Customers
Phase 3: Invoices
Phase 4: Payments

Phase 5: Reports

Phase 6: Testing & Launch
